

INERT-SIEX™ 01

WITH RESTRICTOR

INERT-SIEX™ 01 suits the most demanding requirements with the utmost respect for the environment using **ARGON** as the extinguishing agent. The variety of inert agents in our INERT SIEX range provides a greater variety of discharge characteristics for the most efficient protection.

Thanks to its high density, IG-01 extinguishing agent quickly concentrates in the lower part of the room. It is highly recommended for class A, B and C hazards, in rooms with raised floors. The system works by totally flooding the room, ensuring a complete discharge in less than one minute.

The SIEX team, in compliance with the current regulations for the use of these systems, will study the most suitable design for each hazard depending on the specific needs. With the aid of the latest calculation technology (we have specific VdS certified software) together with our professional experience, SIEX guarantees customized protection regardless of the characteristics of the enclosure.

SIEX has two variants depending on the storage pressure: **INERT-SIEX™ 01 at 200 bar** and **INERT-SIEX™ at 300 bar**, therefore the quantity of extinguishing agent can be adapted to the available storage space for the cylinders. The system is optimized for the worst case conditions, all components are certified to ensure the strictest performance. These are necessary for the storage, detection, release and discharge of the agent at the right moment.
